Simodec : always innovation at Tornos !

Moutier, February 12, 2007

Simodec 2008 will again be a very important event for the high precision turning industry and Tornos will mark the event with the launch of new products. The Swiss manufacturer will exhibit for the first time ever the new MultiSigma 8x24 and the new DECO 13e. The booth will also include the new Micro 7 (presented for the first time at EMO 2007), this like the new Sigma 32 and the Micro.

With the MultiSigma 8x24, Tornos has developed a machine that brings the quality and precision of the MultiAlpha for less manufacturing complex parts. It is now possible to machine multiple parts of average complexity with the "complete solution" including palletizing and manipulation with an investment more compatible with less complex parts.

The DECO 13e employs the same concept, as users don't necessarily need a 12 axis machine to produce some parts. This simplified machine follows in the same vein as the DECO 10e that was launched after the DECO 10a, which proved an exceptional success among customers.

Sigma 32 takes all the benefits of the Sigma 20 and applies them to a machine capable of working up to a 32mm diameter.

Another machine on show will be the Micro 8, the only machine that can produce parts within a +/- 1 micron tolerance on regular production runs. Combined with the Micro 7, both machines offer a perfect solution to replace old cam machines.

If you are a tennis fan you will be aware that the world number one is a Swiss citizen. At Simodec, Tornos will prove that in the game between cam machines and the Micro 7, there is yet another Swiss world number one!

If you require further information on the event or machines on show don't hesitate to call Tornos on 0041 32 494 44 44 or ask your usual Tornos dealer. The worldwide staff of Tornos will be pleased to welcome you on Stand C34 Hall A from March 4th to 8th.
